Ann-Mari De Beer

Data Engineer & Database Administrator

Cape Town / Stellenbosch · annmaridebeer@gmail.com · linkedin.com/in/ann-mari-de-beer

PROFESSIONAL PROFILE

Data Engineer and Database Administrator with a Bachelor of Computing focused on Data Science, Business Intelligence and Data Analytics, and Microsoft Certified in Azure Data Fundamentals (DP-900). Ten months of production experience in First Technology Digital's Data & Analytics unit, supporting SQL Server environments for five managed-service clients: monitoring and health assessments, Availability Groups and disaster recovery, SQL security and access management, patching, SSIS/ETL troubleshooting, SSRS and Power BI reporting, and end-to-end Power Platform delivery.

Main contact for a multi-instance SQL Server support account, where I rebuilt the daily Availability Group and server health reports, resolved Availability Group synchronisation issues, led a SQL Agent job and database ownership review, applied cumulative updates under change control and present the monthly health review to the client. Also the main contact for weekly monitoring and reporting for two further clients, using structured daily and weekly health checks to detect anomalies and diagnose incidents on live systems. Designed and built the internal Goals & Growth reporting platform end to end and delivered a multi-page Power BI dashboard used internally as a client demonstration.

Particularly passionate about Business Intelligence and Data Analytics, especially Power BI dashboards.

KEY SKILLS

- SQL Server administration, monitoring & health assessments
- Availability Groups, high availability & disaster recovery
- Backup, restore, recovery & maintenance
- SQL security & access management
- Patching & change control
- ETL & data integration (SSIS)
- SSRS report development & operational reporting
- Incident diagnosis & production support
- Power BI, DAX & semantic data modelling
- Power Platform (Power Apps, Power Automate, SharePoint)
- SQL development, PowerShell & Python
- Technical documentation & process handover
- Agile & DevOps collaboration
- Client communication, presentations & reporting

NOTABLE ACHIEVEMENTS

- Became the main contact for SQL Server support on a multi-instance client account, and for weekly monitoring and reporting at two further clients
- Rebuilt a client's Daily Availability Group report from scratch after it began returning blank output, adding replica role, colour-coded health, failover data-loss risk and run history
- Turned a Morning Checks report into a Daily Server Report covering six health areas, with date-stamped data, colour-coded health and categorised failed jobs
- Led a SQL Agent job and database ownership review and began moving named-account jobs to service accounts under change control
- Delivered a client-facing SQL Server health assessment across development, test and production servers
- Designed and built the internal Goals & Growth reporting platform end to end as its sole developer

TECHNICAL COMPETENCY SUMMARY

Category	Technologies / tools	Experience
SQL Server administration	SSMS, SQL Agent, Always On Availability Groups, backups, restores & recovery models, cumulative update patching, index and statistics maintenance, ERRORLOG analysis	10 months (workplace)
SQL monitoring & support	SSMS, SSRS, Redgate SQL Monitor, RDCMan, FortiClient, Azure DevOps	10 months (workplace)
Reporting & monitoring	SSRS report development and enhancement, health and history tables, Redgate SQL Monitor reports, client health reporting	10 months (workplace)
PowerShell & automation	Maintaining existing PowerShell scripts and automated jobs; developing own PowerShell monitoring collectors	7 months (workplace)

Category	Technologies / tools	Experience
Data engineering & ETL	SSIS package analysis and debugging, SQL Agent job automation, error handling and logging	10 months (workplace)
Database security	Logins, users and permissions, service accounts, SQL Agent job and database ownership and access reviews	10 months (workplace)
SQL Server health assessments	Health assessments, monthly client health reviews, upgrade planning, performance, backup & recovery, storage design and security reviews, root cause analysis, remediation planning	2 months (workplace)
Power Platform	Power Apps (canvas), Power Automate, SharePoint lists, Microsoft Forms	4 months (workplace)
BI & visualisation	Power BI (DAX, data modelling, RLS), Microsoft Fabric, Excel	1–2 years (workplace & academic)
Cloud data	Azure data services, relational and non-relational data concepts (DP-900)	Certified Jan 2026
Databases	Relational database design, SQL development, query optimisation	2–3 years (workplace & academic)
Programming & data	C#, Java, Python, Pandas, NumPy, Jupyter Notebooks	2–3 years (academic)
Machine learning	Scikit-learn, ML fundamentals	1–2 years (academic)
Project & collaboration tools	Git/GitHub, Azure DevOps, Ruddr, MS Teams	3 years (workplace & academic)

WORK EXPERIENCE

Database Administrator & Data Engineer, Data & Analytics

Jan 2026 – Present

First Technology Digital · Data & Analytics unit, managed services · Cape Town (hybrid)

Supporting SQL Server managed-service clients across monitoring, administration, ETL and reporting. Client names are withheld; engagements are described below.

Client A: SQL Server support, monitoring & reporting

Sep 2026 – Present

Database Administrator & Data Engineer, main contact for SQL Server support

Tech stack: SQL Server, Always On Availability Groups, SSMS, SQL Agent, SSRS, PowerShell, Azure DevOps

Main contact for the client's SQL Server support SLA across a multi-instance estate of production, test and development servers running Always On Availability Groups. Covers daily health and Availability Group monitoring, reactive support, patching, and a monthly health and improvement review presented to the client.

- Performed daily SQL Server and Availability Group health checks covering failed jobs and logins, disk space, backup status, replica roles, synchronisation state, and version and patch levels
- Rebuilt the Daily AG Report from scratch after it began returning blank output: traced the fault to a missing loader, wrote a PowerShell collector that loads a central AG health table with run history, and updated the SSRS report with replica role, colour-coded health and failover data-loss risk
- Rebuilt the Morning Checks report into a Daily Server Report covering six health areas, fixing report logic and data consistency and adding date-stamped tables, colour-coded health and categorised failed jobs
- Resolved Availability Group synchronisation failures by reviewing replica health, sync state and seeding, re-adding databases on unsynchronised secondaries, moving a database into the correct AG and escalating storage constraints
- Restored a production database to the test environment and validated it, and enabled Service Broker on an AG database by taking it out of the AG, enabling the broker and re-adding it
- Investigated job failures across many instances and produced a failed-jobs overview and action plan for the client
- Led a SQL Agent job and database ownership review, classifying every owner as a named, service, system or unknown account, and began moving named-account jobs and databases to service accounts under change control
- Applied SQL Server cumulative updates to 13 development and jump-server instances under change control
- Prepared and presented the monthly health and improvement review (health position, actions required, prioritised recommendations) and took part in the client's DR simulation workshop

Clients B & C: weekly monitoring and reporting

Jan 2026 – Present

Database Administrator, main contact for weekly monitoring and reporting

Tech stack: SQL Server, SSMS, SQL Agent, Azure DevOps, Redgate SQL Monitor, RDCMan, FortiClient

SQL Server monitoring and support under ongoing SLAs for two clients: recurring health checks, weekly monitoring reports and ad-hoc investigations across production and test servers.

- Performed daily SQL Server health checks and became the main point of contact for each client's weekly monitoring and reporting

Client B

- Daily checks covered database and service availability, full, differential and log backup completion, drive space, failed logins, SQL Agent job outcomes and ERRORLOG review
- Compiled the weekly monitoring pack (key-issues email, PDF report with an issue severity matrix and patch, login, job, index-maintenance and backup checks, and an Excel status workbook), tracked as recurring work items on the team's DevOps board
- Ran a login and authentication investigation that identified missing and misconfigured logins, incorrect database mappings and domain-trust issues, and produced actionable recommendations
- Maintained fragmentation, statistics and integrity-check tasks, improved SQL queries, and investigated a backup failure by correcting the backup maintenance plans
- Produced SQL login and user lists on request, disabled accounts that should no longer be active, and documented the active databases and their purpose

Client C

- Observed and documented how weekly reporting and monitoring were carried out, then took over daily production health checks under supervision before becoming the main contact for weekly reporting
- Designed a Redgate SQL Monitor report for daily DBA checks and produced the weekly Word/PDF monitoring report covering data and log file sizes, server performance and SQL Server health
- Investigated a backup-related issue and re-enabled a disabled job to return it to normal operation
- Carried out after-hours maintenance under change control, including creating missing indexes and shrinking transaction logs to relieve disk pressure
- Prepared change-control forms and a handover document to keep monitoring covered during leave

Client D: data operations support (SSIS / ETL)

Apr 2026 – Present

Data Engineer & Database Administrator, 1 of 2 points of contact

Tech stack: SQL Server, SSIS, SQL Server Agent, SSMS, SSRS, Power BI, PowerShell, Python

Took over the data-operations account of a departing colleague. Scope covers SSIS/ETL pipelines, SQL Agent jobs, Power BI and SSRS report maintenance, month-end and payment processing, and incident resolution.

- Analysed SSIS package structure, data flows, mappings and transformations to reconstruct an undocumented environment
- Resolved SQL Agent job failures caused by missing or blank source files by tracing them through SSIS logs, confirming the external dependency and validating a clean re-run
- Executed the month-end cycle, including payment file generation through SSIS packages and SQL jobs and the month-end SSRS reports, and produced the payment report semi-manually when the automated process failed on unclean input
- Resolved multiple production incidents, including data-load failures traced to corrupted source files and restored from verified backups, an all-zeros reporting bug fixed at the processing step, and job failures re-run with corrected configuration
- Enhanced multiple SQL jobs with error handling and detailed logging to make future failures easier to diagnose
- Restored Power BI reports that failed to refresh, including rebuilding a semantic model, and fixed SSRS report and data errors including a date-conversion processing error
- Traced API job failures to outdated identifiers, updated them and backfilled the missing figures; applied client change requests to reporting; compared source files with SQL tables to answer business data queries

Client E: Power BI to Microsoft Fabric migration

Jul 2026 – Sep 2026

Data Engineer, supporting team member

Tech stack: Power BI, Microsoft Fabric

- Migrated several Power BI workspaces to Microsoft Fabric as part of a lift-and-shift migration, and took part in migration planning and execution meetings

Client F: SQL Server health assessment

Jul 2026

Database Administrator

Tech stack: SQL Server, SSMS, SQL Agent, Windows Server, PowerShell, Excel

Comprehensive health assessment of the client's production environment against Microsoft best practices, documented in a formal client-facing report.

- Assessed OS and SQL Server versions, edition, instance configuration, compatibility levels, storage design, maintenance processes and backup strategy
- Analysed configuration against Microsoft best practices, including Cost Threshold for Parallelism, MAXDOP, allocation unit sizes and storage layout
- Assessed backup and recovery capabilities: schedules, transaction log backups, recovery models, retention and disaster recovery readiness

- Investigated SQL Agent job failures, identified root causes and provided remediation recommendations; reviewed index fragmentation and missing indexes
- Identified unsupported Windows Server and SQL Server versions and developed upgrade recommendations with compatibility and risk considerations
- Recommended dedicated data, log, TempDB and backup volumes aligned with Microsoft standards
- Wrote the client report with executive summary, issue severity matrix, remediation plan, risk assessment and technical recommendations, validated with internal DBAs through peer review

Internal project: Goals & Growth reporting platform 2026

Sole designer and developer (full-stack, low-code)

Tech stack: Microsoft Forms, SharePoint lists, Power Automate, Power Apps, Power BI, DAX

End-to-end internal platform that lets employees capture quarterly goals and gives managers a gamified view of team progress and motivation.

- Wrote a Business Requirements Document (objectives, scope, KPIs, architecture, testing, risks) and a Dashboard Request Document covering DAX scoring and ranking logic, row-level security, a custom financial-quarter calendar and gamification
- Built the data-collection layer in Microsoft Forms with required sign-in, and modelled four normalised SharePoint lists for employees, sessions, goals and points rules
- Developed four Power Automate flows (submission processing, quarter-end carry-over, target-date locking, automatic completion) and resolved a mutual-trigger loop between two flows
- Built a Power Apps canvas app with role-based navigation separating employee and administrator views, working around delegation limits with collections
- Delivered a Power BI report with manager overview, employee drill-down and leaderboard using shared DAX measures and row-level security

Internal project: Sales Analytics dashboard 2026

Developer, Power BI upskilling track; used as a client demonstration dashboard

Tech stack: Power BI, DAX

Three-page dashboard over a financial year of order data (April 2025 to March 2026), moving from headline sales, to sales performance, to operational insight on when customers order.

- Sales Overview: KPI cards for revenue, orders, average order value and units with month-on-month change, a monthly revenue trend, and revenue by size and category
- Sales Performance: weekly revenue by product size, monthly revenue by category and an all-products performance table with share of total revenue
- Operational Insights: busiest hour and day cards, orders by day and hour, and an hour-by-day heatmap to support staffing and preparation planning
- Designed and built all pages and added slicers for date range, rolling period, category, size and day of the week

Internal project: Microsoft Fabric medallion architecture 2026

Developer, Fabric upskilling track

Tech stack: Microsoft Fabric, SQL

- Built a medallion architecture (bronze, silver, gold) with a semantic model on top, and wrote stored procedures for null handling across 28+ tables

CERTIFICATION

- **Microsoft Certified: Azure Data Fundamentals (DP-900)** · January 2026

EDUCATION

- **Bachelor of Computing, Data Science & Business Intelligence** · Belgium Campus iTversity · NQF 7 · honours (NQF 8) in progress

Focus: Data Science, Business Intelligence, Data Analytics, Machine Learning, Database Development, Project Management

- **National Senior Certificate** · Glenwood College High School

UNIVERSITY PROJECTS

International Hyacinth Team Project 2025

Group project, Belgium Campus

- Built a data-driven website that fuses historical data, machine learning and environmental monitoring to help forecast and manage water hyacinth growth at Hartbeespoort Dam, South Africa

Machine Learning Projects 1 & 2 2023 – 2025

Individual and group projects, Belgium Campus

- Collected, cleaned and analysed datasets with Python (Pandas, NumPy, Jupyter) and applied scikit-learn techniques to solve analytical problems
- Designed and implemented relational SQL databases, built Power BI visualisations, and presented findings in reports and presentations
